

Data & Control Debt: Building an Audit-Ready Control Environment

A platform can be live, compliant on paper, and still unable to answer a simple evidentiary question.

Data and control debt is the gap between reporting designed for internal operations and reporting designed to withstand external scrutiny. It is rarely visible in system logs — it surfaces the moment a regulator, auditor, or institutional counterparty asks for the evidence behind a number.

Five Signals of Data & Control Debt

1. Reconciliation between on-chain activity and off-chain records happens ad hoc, not as a continuous control.
 2. KYC data is fragmented across systems, with no single owner for the unified audit trail.
 3. Regulatory reporting evidence cannot be reconstructed independently of the person who originally produced it.
 4. Proof of reserves has been asserted, but never tested end-to-end under audit conditions.
 5. Data lineage and ownership are undefined — no one can say, system by system, who is accountable for the accuracy of a given data point.
-

Key Principle

The control environment must exist before the question is asked — not be assembled in response to it.

It is a standing capability: defined ownership, reconstructable evidence, and reconciliation that runs continuously rather than on request.

Execution Gap Assessment

The Execution Gap Assessment evaluates reconciliation, KYC data integrity, reporting evidence, and reserve verification across the operating model.

Identify the gap before the regulator does.

Execution Gap Assessment

Available for CASP holders and digital asset platforms preparing for audit or regulatory review.
